Structure Specifications

Corrosion Resistance

Aluminium naturally generates a protective oxide coating and is highly corrosion resistant. Different types of surface treatment such as anodising, painting and lacquering can further improve this property. It is particularly useful for applications where protection and conservation are required.

Anodized Aluminium

Anodizing is an electrochemical process that converts the metal surface into a decorative, durable, corrosion-resistant, anodic oxide finish. Aluminium is ideally suited to anodizing. Provides minimum maintenance, highly durability for exteriors applications.
